

Frontend Update Summary

Session changelog — 23 August 2026

This document summarizes the fixes and features implemented in this session, covering the shared backend, registration, IPFT results, messaging, notifications, reports, PT plans, the dashboard, and the Soldiers/approval workflow.

1. Mobile & Dev Environment

- Fixed a broken dependency install (babel-preset-expo missing from the hoisted node_modules) that was silently crashing every bundle.
- Fixed a React / react-native-renderer version mismatch that crashed the app immediately on native (Expo Go) after loading.
- Set up Expo Go QR code and web links so the app can be opened and tested on both phone and laptop, on the local Wi-Fi network.

2. Shared Backend (architecture fix)

- Replaced per-device local storage (AsyncStorage) with a small shared data server, so registrations, messages, notifications and reports are visible from every device instead of being trapped on whichever phone/laptop created them.
- Added a file upload/download API so Reports and PT Plans can carry real PDF/DOC files instead of just a filename label.
- Added server-side PDF generation (pdfkit) for PT plans, so downloading a plan produces a real, selectable-text PDF file instead of opening a browser print dialog.

3. UI / Layout

- Fixed the app showing a different background color on phone vs laptop by forcing one consistent theme regardless of each device's system setting.
- Enlarged the logo and navigation icons for legibility.
- Fixed the Soldier Registration form losing keyboard focus after every keystroke (an input-remounting bug), which had made it impossible to type more than one character at a time.

4. Soldier Registration

- Medical Category simplified to Category A / B / C (previously SHAPE-1/2/3).
- "Age" replaced with Date of Birth — age is now calculated automatically from the entered birth date.
- Added a required Address field.
- Added an optional "Previous IPFT Result" (Pass / Fail) and "Biannual Period" (1st / 2nd) capture, for soldiers arriving with a result from a previous unit — saved to their IPFT history and clearly marked as self-reported.

5. IPFT Results

- Fixed the 1.6km / 3.2km run results always showing FAIL, caused by a fragile MM:SS text parser that silently failed on almost any input.
- Redesigned result entry as an explicit Pass/Fail tap per item instead of free-text parsing.
- Added the full obstacle-course item set: Swimming, Beam, Knee Bending, Horizontal Rope, Fireman's Lift, Wall (alongside Run/Push-ups/Sit-ups/Pull-ups).
- The result notification sent to a soldier now names the specific items they failed, instead of a generic pass/fail message.
- Saving a result automatically sets the soldier's Fit/Unfit status and the correct PT plan (Fit vs Rehabilitation) is shown on their dashboard.
- Full IPFT history is preserved on each soldier's profile — new results never overwrite old ones.

6. PT Plans

- Soldiers can download their weekly PT plan as a real PDF file with one tap — no browser print dialog, on either phone or web.

7. Messaging

- Rebuilt Messages as a real free-text chat between staff roles (CO, 2IC, Company Commanders, Adjutant, Clerk) — Soldiers do not have access, matching the unit's intended chain of communication.
- Removed the file-attachment option from Messages per request (kept for Reports, where it is actually needed).

8. Notifications

- The IPFT date proposal / approval / rejection workflow now lives in Notifications, with a real tappable calendar instead of typing a date as text.
- Fixed a privacy bug where Soldiers could see notifications meant for staff about other soldiers (e.g. an overweight alert about a different soldier) — Soldiers now only see notices addressed specifically to them or genuine all-unit broadcasts.

9. Reports

- Clerk now picks a specific recipient (CO, 2IC, a named Company Commander, or Adjutant) before writing a report, instead of it always going to Adjutant.
- Reports can carry a real uploaded PDF or Word document, which the recipient can open/download — not just a typed filename.

10. Dashboard

- Added IPFT result graphs: company-wide pass rate for CO, Fit/Unfit/Overweight breakdown for Company Commanders, and a personal result trend for Soldiers.
- Fixed "Total Strength" not increasing after the Adjutant approves a new soldier — counts now correctly include only approved soldiers.

11. Soldiers List & Approvals

- Fixed a critical cross-platform bug: on the web version, every confirmation/success dialog (Approve, Delete, Send, Save, etc.) was silently doing nothing, because the web build's Alert component never actually shows a dialog or runs the button's action. Replaced it everywhere with a helper that works correctly on both web and native — this was the root cause of “Adjutant can't approve” and several other reported dead buttons.
- Adjutant can Approve or Delete a pending registration; approving removes it from the pending list immediately and adds the soldier to Total Strength.
- Adjutant can now also delete any already-approved soldier's account directly from the Soldiers list.
- Renamed a confusing filter label: the “Pending” status chip (meaning “not yet IPFT-tested”) is now labeled “Awaiting Test” so it isn't confused with a registration awaiting approval.

12. Profile

- Self-edit fields simplified to: Email, Phone, Company, Height, Weight, Age, Address — Blood Group and Medical Category removed from self-edit (clinician-verified fields).
- When a Soldier edits their own profile, the Clerk is notified with exactly which fields changed.
